 The Netherlands

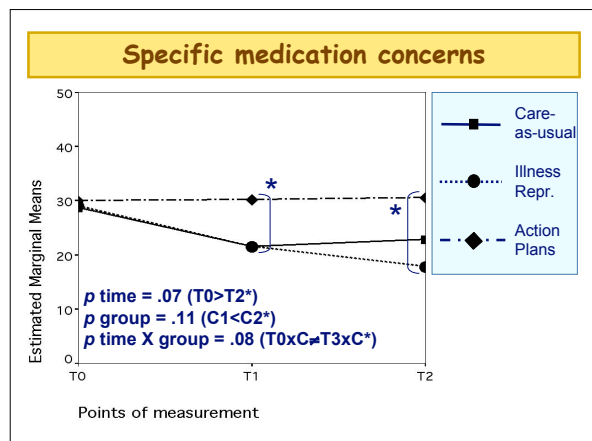

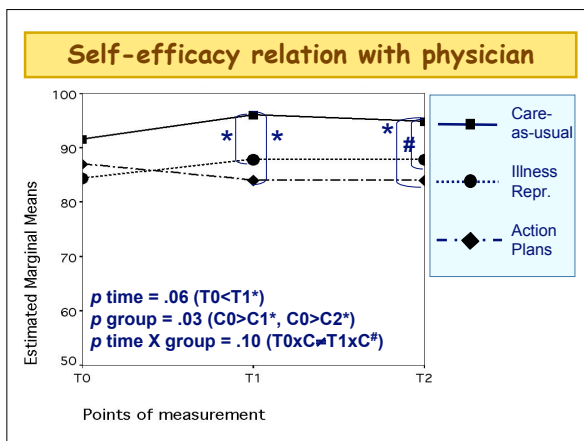

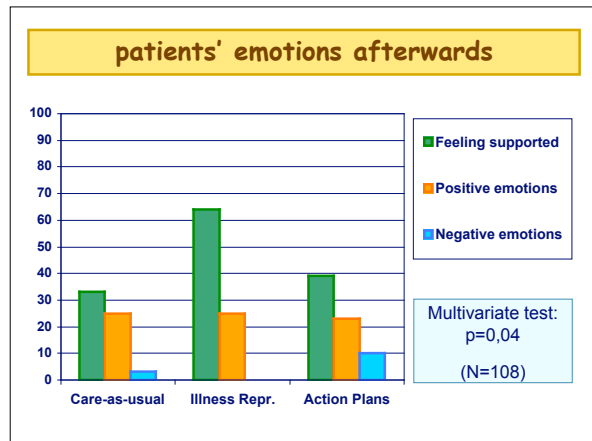

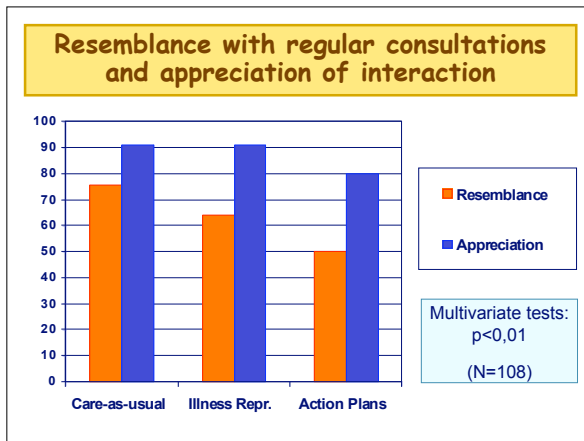

Adherence interventions

- Adherence is very change resistant
- Intervention studies (Haynes RB, 2000) :
 - 'mono' interventions not effective
 - effective studies complex, labour-intensive and arbitrarily
- Back to theory: unravelling intervention components
 - effects on a patient level

- ### GP training content
- **Both conditions**
 - use video taped role play for training
 - use a semi-structured conversation format
 - need a training of two sessions
 - require a mind switch of the GP-trainees

Conclusions

- The training worked as intended
- Both experimental conditions were feasible
- Hypothesised feedback loop of the model somewhat supported
- Nevertheless: conditions had different effect on patients illness representations and Action plans
- Combination of techniques suggested
- Future research: GP instead of GP-trainees
